## "AV-Ready" Cities or "City-Ready AVs?"

## Summary of **Meeting Agenda**:

- City needs, city experiences: ITF, London, Los Angeles, Columbus, US DoT
- **Scenarios** of AV introduction (ownership vs demand-led): Toronto
- What can industry deliver: Lyft, Qualcomm
- Coexistence period, action planning

## 12. "AV-Ready" Cities or "City-Ready AVs"?

**Summary** of Key Findings/Lessons Learned from Breakout Discussion:

- 1. Automation is getting on the urban policy agenda.
  - Are city policies on the automation agenda of industry, academia, government?
  - Automation is a **tool to implement policies** (wider institutional, financial and policy context, business case).
  - Which **transport problems** can automation help to solve more effectively than other technologies or policies? (clean fleets, mobility as a service, ...)
- 2. Dynamics: What is the turning point, where AVs are generating a transport impact in urban contexts?
- 3. Challenges
  - Avoiding unintended impacts/ disbenefits, while dealing with uncertainties
  - Lack of qualified staff in administrations and proper planning tools and assumptions
  - Need to make long-term infrastructure decisions and keeping pace with many changes
- 4. **Co-existence** of AV's and conventional vehicles will be a long (and potentially messy) period.
- 5. In order to benefit from automation, cities must proactively push for **behaviour change** and create an **enabling policy framework**.

## "AV-Ready" Cities or "City-Ready AVs?"

Recommended Action Items: An Urban Automation Agenda (Version 0.1)

- 1. Develop visions of how automation can help "transform mobility as we know it".
- 2. Promote behaviour change through **shared mobility** services, quality **transit development**, and **demand management** policies.
- 3. Support local shared vehicle pilots. Identify impacts, upscale when successful.
- 4. Think about "increasingly AV enabled" corridors (policy and technology) and how they develop over time ("AV only"); interaction with other modes.
- 5. Develop scenarios for re-using **parking space** (e.g. as freight hubs, pick-up areas) and how **transit infrastructure** (e.g. interchanges) would develop.
- 6. AV-ready infrastructure: consider obsolescence, resilience, (new) liability issues.
- 7. Automation of **freight** and **transit** deserve special attention; incl new service models. Building regulations.
- 8. Address **public perception**, involve **stakeholders**.
- 9. Develop automation work plan with partners and stakeholders (and internal working group).
- 10. Engage in joint learning and in dialogue with industry, academia and government.
