

## Analysing the impact of new mobility measures in your city

### Course description

New mobility projects can impact many areas, including accessibility, equity, safety, liveability, health, the environment and public budgets. Neglecting any of these can lead to unsustainable planning. An assessment prior to implementation helps you select appropriate and cost-effective mobility measures and gives you an idea whether the measures will bring the intended results. TIDE has developed a straightforward tool for determining the impacts of new transport measures. In this course, you can use the tool to assess measures from your own local context.

### Target audience

Practitioners in local administrations across Europe who would like to understand the impact of various new mobility measures on their local environment

### Thematic area

Impact assessment
